

Release Note: main → production

flucoma-cli | <https://github.com/flucoma/flucoma-cli>

Generated 5 October 2026 from the repository's branch tips (origin/main and origin/production).

Summary

There are no functional differences between the tip of main and the tip of production. The two branches contain byte-identical file trees. Production is ahead of main by a single merge commit, which records the 1.0.9 release; main has no commits that production lacks.

Anyone promoting main to production would therefore ship nothing new: production already contains everything on main.

Branch Tips

Branch	Tip commit	Date	Description
main	b1e88f2	2025-04-01	Merge pull request #53 from flucoma/fix/update-ubuntu
production	b16b311	2025-08-31	Merge pull request #55 from flucoma/pre-production ([release] 1.0.9)

Merge base: b1e88f2, which is the main tip itself. Commits on main not in production: 0. Commits on production not on main: 1. Files changed between the two tips: 0.

Release tag at the production tip: 1.0.9.

Changes in This Comparison (main → production)

Commit	Date	Author	Summary
b16b311	2025-08-31	tremblap	Merge pull request #55 from flucoma/pre-production; [release] 1.0.9. Merge commit only, no file changes.

This commit carries the release trigger and nothing else: its content is already present on main.

Background: What Is in 1.0.9

For readers who want to know what the current production release contains relative to the previous release (1.0.8, dated 2025-01-07), the changes below were merged to main before it was released and are part of production now.

Build and release infrastructure

- CI and release runners moved from Ubuntu 20.04 to Ubuntu 22.04 (nightly and release workflows). Commit 199c665, 2025-03-29, Pierre Alexandre Tremblay.
- Windows and Linux release archives are now named with an architecture suffix: FluCoMa-CLI-Windows-x64.zip and FluCoMa-CLI-Linux-x64.tar.gz (nightly equivalents likewise). Anything that downloads these assets by file name needs updating.

Source

- Updated include paths in FluidCLIWrapper.hpp to the flucoma/ namespaced core headers (for example flucoma/clients/common/FluidBaseClient.hpp) following an update of the FluCoMa core. Commit a0dfac5, 2025-03-26, Owen Green.

Earlier change shipped in this range

- Added reporting of the processor architecture the CLI was compiled for. Commit 9a63e10, 2024-12-12, Pierre Alexandre Tremblay.

Upgrade Notes

- No action is needed for main → production; the branches already match.
- If you script downloads of release assets, use the new -x64 file names for Windows and Linux.

Method

Compared with git against a fresh clone: git log origin/production..origin/main and origin/main..origin/production for commits, git diff origin/main origin/production for content, and git log 1.0.8..origin/production for the background section. The pre-production branch tip (b1e88f2) equals main.
